## Regular Polygon Tessellations Data Table

Any point on a polygon where two adjacent sides meet is called a vertex. The sum of the interior angles of all of the polygons that meet at a vertex is $360^{\circ}$. How can we use this fact and the interior angle measure of each polygon to determine whether a regular polygon will tessellate a plane? Which regular polygons will tessellate a plane? Which will not?

| Polygon | Number of <br> Sides (n) | Length of a <br> side | Interior Angle Measure(180(n-2)/n) |
| :--- | :--- | :--- | :--- |
| Triangle |  |  |  |
| Rectangle |  |  |  |
| Hexagon |  |  |  |
